Protocol Synopsis

Protocol Synopsis : In Thailand, there is no clear guideline on vitamin D supplementation for infants. Currently, there is not enough information about vitamin D status in Thai infants to support physician decisions or to guide medical practice. The study participants will be recruited from the mother who brings the infants for a routine health check at the well-baby clinic at the age of 2-3 months. Only the mothers who have been successfully exclusively breastfed and have an intention to exclusively breastfeeding until the infant turn 6 months will be eligible to participate in the trial.
After signing an informed consent, the infants will be randomized into two groups.
1) The control group; the baby will only be breastfed until the baby reaches the age of 6 months
2) the experimental group; the baby will be breastfed and receiving vitamin D supplementation (400 IU/day) until the baby is 6 months

Health Conditions

Health Condition(s) or Problem(s) Studied : Exclusively breastfed Full-term infants at the age 2-3 months
Keywords : Exclusively Breastfed, Full-term infants, Vitamin D supplement

Eligibility

Inclusion Criteria : Only the mothers of full-term, healthy infants who have been successfully exclusively breastfed and have an intention to exclusively breastfeeding until the infant turn 6 months will be eligible to participate in the trial.

Gender : Both

Age Limit : Minimum : 1 Months Maximum : 3 Months

Exclusion Criteria : - Infants with congenital anomaly
- Any formula-feeding infants

Accept Healthy Volunteers : Yes

Status

Overall Recruitment Status : Completed

Key Trial Dates Study Start Date (First enrollment) : 02 July 2019 Indicate Type : Actual

Completion Date (Last subject, Last visit) : 15 October 2020 Indicate Type : Actual

Study Completion Date : 31 December 2020 Indicate Type : Actual

Design

Study Type : Interventional

Primary Purpose : Treatment

Study Phase :

Intervention Model : Parallel

Number of Arms : 2

Masking : Open Label

Allocation : Randomized

Control : No treatment / Standard of care

Study Endpoint Classification : N/A

Sample size

Planned sample size : 100

Actual sample size at study completion : 87

Intervention Arm 1

Intervention name : Exclusive breastfeeding

Intervention Type : No Intervention

Intervention Classification : No treatment

Intervention Description : 1) The control group; the baby will only be breastfed until the baby reaches the age of 6 months

Intervention Arm 2

Intervention name : Exclusive breastfeeding and Vitamin D supplement

Intervention Type : Experimental

Intervention Classification : Drug

Intervention Description : 2) the experimental group; the baby will be breastfed and receiving vitamin D supplementation (400 IU/day) until the baby is 6 months

Outcome**Primary Outcome**

1. Outcome Name : Infant vitamin D level

Metric / Method of measurement : serum 25OHD level (LC-MS)

Time point : at the age of 6 months

Secondary Outcome

1. Outcome Name : Infant calcium level

Metric / Method of measurement : serum calcium level

Time point : at the age of 6 months

2. Outcome Name : Infant PTH level

Metric / Method of measurement : serum PTH level

Time point : at the age of 6 months
3. Outcome Name : Infant phosphorous level
Metric / Method of measurement : serum phosphorous level
Time point : at the age of 6 months
4. Outcome Name : Infant ALP level
Metric / Method of measurement : serum ALP level
Time point : at the age of 6 months
5. Outcome Name : Mother vitamin D level
Metric / Method of measurement : serum 25OHD level (LC-MS)
Time point : when infant turn 6 months

Summary Results

Date of posting of results summaries : 27 August 2021
Date of first journal publication of results : Not yet published
Baseline Characteristics : Full-term, exclusively breastfed infants were randomized into two groups at 2 months of age to continue exclusive breastfeeding either without vitamin D supplementation (control group, 50 infant-mother pairs) or with vitamin D3 supplementation at 400 IU/day (intervention group, 50 infant-mother pairs) until 6 months of age.
Participant Flow : At 6 months, 44 infant-mother pairs in the control group 43 infant-mother pairs in the in tervention group complete the study.
Adverse events : None

Outcome Measures : At 6 months, the serum vitamin D (25OHD) of the infants and their mothers, serum bone marker, and infants' growth parameters were compared between the two groups.

Brief Summary of Results : The infants' serum 25OHD concentration was lower in the control group than intervention group. More infants had vitamin D sufficiency (25OHD of more than 20 ng/mL) in the intervention group than the control group. There were no significant differences in the maternal 25OHD concentrations between the control and intervention groups. Serum calcium, phosphorus, intact parathyroid hormone, alkaline phosphatase, and infants' growth parameters were comparable between the two groups.

Deidentified Individual Participant-level Data Sharing

Plan to share IPD : Yes

Plan description : The datasets used and/or analysed during the current study are available from the corresponding author on reasonable request.
